 used in positively selecting transgenic cells from a population of cells Using the positive selection method, the presence of the gene of interest in the genetically transformed cells may be determined without the disadvantages associated with traditional negative selection systems. Positive selection of the transformed cells is achieved without directly damaging the neighbouring non-transformed cells. The transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes into the environment. The present sequence is Escherichia coll strain C ribitol dehydrogenase encoded by ribitol operon (rti operon). The operon also encodes ribitol kinase and ribitol transporter.
 gene and
e.g., ara
 The present invention relates to a positive selection system that involves conferring to transferred cells the ability to metabolise arabitol, ribitol and/or mannitol. The positive selection method is

 The invention relates to DNA sequences encoding enzymes required for clavulanic acid blosynthesis. Clavulanic acid is a broad spectrum beta-lactamase inhibitor and is an important antibotic for the treatment of infectious diseases. Also provided in the patent is a 15 Kb genomic DNA fragment downstream to pcbC gene from Streptomyces clavuligerus. The genomic DNA comprises 10 open reading frames (ORFs), eight of which are involved in clavulanic acid biosynthesis. The present sequence is S. clavuligerus clavulanic acid biosynthesis enzyme encoded by ORF9.

 A new enzyme is disclosed which has clavulanic acid dehydrogenase activity, the enzyme having an apparent mol. wt. of 28 kD (by SDS PAGE) and incorporating the N-terminal sequence PSALQGKVALITGASSGIGE. The enzyme is derived from the mycelium of a Streptomyces species, especially S. clavulagerus (e.g. ATCC 27064), S. jumojensis (e.g. ATC 29864) or S. katsurahamanus (e.g. T272). The present sequence represents the enzyme from S. clavuligerus ATC 27064.

 This sequence represents the claDH protein which is a putative clavulanate-9-aldehyde reductase used in the biosynthetic pathway for clavulanic acid in Streptomyces clavuliquerus. The invention relates to methods of improving production of clavulanic acid by Streptomyces by super-expression of claR gene. The claR gene is characterised in that it is localised in the gene group encoding genes for biosynthesis of

particularly S. epidermidis infections. The sequences screen for compounds able to interfere with the S. epicycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form particular than the sequence data for this patent did not form particular than the sequence data for this patent did not form particular than the sequence data for this patent did not form particular than the sequence data for this patent did not form particular than the sequences. ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to for this patent did not form part of the pri obtained in electronic format directly from epidermidis printed

The present invention provides human cDNAs, proteins and related gen DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequis a protein of the invention.
 Isolated nucleic acid polypeptide is used in condition

The present invention relates to the isolation of novel human enzyme C polypeptides, and the cDNA (AAS40785-AAS41684) and genomic sequences c encoding them. The enzyme polypeptides of the invention may comprise the functional classes of oxidoreductases, transferases, hydrolases, lyases, isomerases or ligases. The sequences of the invention are useful in the c diagnosis, treatment, prevention and/or prognosis of a wide range of c diagnosis, treatment, prevention and/or prognosis of a wide range of c disorders including hyperproliferative disorders (e.g. cancer), cc (e.g. arthritis), neurological disorders (e.g. Alzheimer's disease), c metabolic disorders (e.g. phonylketonuria), inflammatory disorders (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis), c c (e.g. asthma), cardiovascular disorders (e.g. atherosclerosis). The blood-related disorders (e.g. haemophilia), reproductive disorders (e.g. infertallity) and infectious disorders (e.g. Influenza). The c polynucleotides of the invention can also be used in gene therapy.

 disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia an epilepsy; and (f) infectious diseases such as viral, bacterial, fung and parasitic infections.
 The invention relates to novel genes (AAI62752-AAI62961) and proteins (AAM42347-AAM42415) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast

 The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proteins, PRO179, PRO238, PRO364, PRO844, PRO846, PRO1760, PRO205, PRO321, PRO333, PRO840, PRO877, PRO878, PRO879, PRO882, PRO885 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted
 proteins were proteins. The

 The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restensis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention.

 Q
 CC ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to CC ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, CC antianglogenic, hypotensive, vulnerary and antiarteriosclerotic CC activities, and can be used in gene therapy. The PRO polynucleotides, CC proteins, agonists and antagonists are useful for treating or diagnosing CC a cardiovascular, endothelial or angiogenic disorder in a mammal, CC e.g. cardiac hypertrophy, trauma, cancer, age-related macular CC degeneration, atherosclerosis, hypertrasion, arterial restenosis, CC rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, CC lymphangitis, tumour angiogenesis (such as breast carcinoma and liver CC carcinoma) and wound healing. The PRO polynucleotides have applications CC in molecular biology, including use as hybridisation probes, and in CC chromosome and gene mapping. ABL88259 to ABL88267 represent primers and CC probes used in the exemplification of the present invention.

 This OXRE-10 has identity with an insect-type alcohol dehydrogenase. The polypeptides are useful for treating or preventing a disorder associated with decreased expression or activity of OXRE. Antagonist OXRE are useful for treating or preventing a disorder associated with increased expression or activity of OXRE. The disorders include cell proliferative disorders (cirrhosis, hepatitis), cancer (leukemia, melanoma), hypopituitarism and hyperpituitarism, hypothyroidism and hyperthyroidism, metabolic disorders (Addisor, Sulatory Officer), and the procession of the disorders (Addisor, Sulatory Officer).
 autoimmune/inflammatory disorders (acquired immunodeficiency syndrome (AIDS), asthma, osteoarthritis), and viral infections. The polynucleotides may be used in Southern or Northern analysis, polymerase chain reaction (PCR), or in enzyme-linked immunosorbent assays (ELISA).
 fibrosis), reproductive disorders (infertility, ovulatory defection neurological disorders (Alzheimer's disease, Parkinson's disease multiple sclerosis), mental disorders (anxiety, schizophrenia),

 Run on:
 OM protein - protein search, using sw model
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 gene and
e.g., ara
 used in positively selecting transgenic cells from a population of cells using the positive selection method, the presence of the gene of interest in the genetically transformed cells may be determined without the disadvantages associated with traditional negative selection systems. Positive selection of the transformed cells is achieved without directly damaging the neighbouring non-transformed cells. The transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes into the environment. The present sequence is Escherichia coll strain C ribitol kinase encoded by ribitol operon (rtl operon). The
 The present invention relates to a positive selection system that involves conferring to transferred cells the ability to metabolise analital, ribital and/or mannital. The positive selection method is

The invention relates human kinases (PKIN) and their corresponding CC nucleic acid sequences. PKIN and its DNA are useful for diagnosing, CC treating and preventing cancer, an immune system disorder (e.g., CC acquired immune deficiency syndrome (AIDS), Addison's disease, allergy, CC affecting growth and development (e.g., arteriosclerosis, cirrhosis, CC affecting growth and development (e.g., hypertension, myccardial) CC infarction, Goodpasture's syndrome), and a lipid disorder (e.g., fatty CC liver, Gaucher's disease, Niemann-Pick's disease, hypercholesterolaemia, Obesity), and for assessing the effects of exogenous CC compounds. Anti-PKIN antibody is useful in a diagnostic test for a CC condition or a disease associated with the expression of PKIN in a biological sample. A composition comprising PKIN or an agonist or CC entagonist of PKIN is useful for treating a disease or condition CC PKIN is useful in a number of drug screening techniques and to analyse CC the proteome of a tissue or cell type. PKIN DNA is useful for creating knockin humanised animals or transgenic animals to model human diseases, and in somatic or germline gene therapy. The present sequence is human contains.

 immunosuppressant and cytostatic activity. The polynucleotides are useful impunosuppressant and cytostatic activity. The polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny, Inhibin activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

 capable of detecting 1000 or more genes from Drosophila. The inventueseful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL16171), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB72072).

 the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification of the protein the protein and proventions.

Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful for treating acne vulgaris

Example 1; SEQ ID No 340; 1069pp; English

the treatment, prevention and diagnosis of medical conditions caused by CP. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. CP. acnes is also involved in infections of bone, joints and the central concrous system, however it is particularly involved in the inflammatory clesions associated with acres in a patient comprises contacting the presence or absence of P. acnes in a patient comprises contacting a cc sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The cc polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and ct therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by cenzyme linked immunosorbent assay (ELISA).

CC specification, but was obtained in electronic format directly from WIPO contactions. Sequences AAU39105-AAU68017 represent Propionibacterium acnes polypeptides. The proteins and their associated DNA sequences ftp.wipo.int/pub/published\_pct\_sequences. immunogenic are used in

 This polypeptide comprises the L-ribulokinase of Bacillus subtilis, encoded by the araB gene of the ara operon (see AAV255 This enzyme is involved in the utilisation of L-arabinose by B. subtilis. The invention relates to the strong promoter (see AAV25567) of the ara operon, which is induced by L-arabinose and repressed by glucose, and its use in regulating the expression cheterologous genes in prokaryotic hosts.

Controlled the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of a noligonucleotide comprises as sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end complementary strand of a polynucleotide which comprises a 5'-end complementary to a complementary to a complementary to a polynucleotide which comprises a 3'-end sequence complementary to a compount of the specification. The primers are useful for those defined in the specification. The primers are useful for synthesising polynucleotides, therapy if he primers are useful for synthesising polynucleotides, and comprises a selected from those defined in the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and CNAH36393 represent human amino acid sequences; and AAH3629 to AAH33632 crepresent oligonucleotides, all of which are used in the exemplification of the present invention.
 The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary
 Primer sets for synthesizing polynucleotides, particularly the full-length cDNAs defined in the specification, and for the detail and/or diagnosis of the abnormality of the proteins encoded by

 ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the
 Novel isolated nucleic acid encoding a Staphylococcus epidermidis polypeptide, useful for diagnosing and treating bacterial infections

 CC (II), given in AABS3970 represent nucleic acids (I) encoding polypeptides ((II), given in AABS1454 to AABS3120, from Staphylococcus epidermidis. ((I) and (II) can have antibacterial activity and therefore can be used to in vaccination. The nucleic acids (I) may be used to produce the containing them which are used to produce hosts cells which express the containing them which are used to produce hosts cells which express the polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. CC The polypeptides may also, be used to assay for other inhibitors of their cativity and therefore identify compounds that may be used for the ctraatment of S. epidermidis infections, e.g. endocarditis. AAB53971 to AAB55090 represent specifically claimed S. epidermidis genomic DNA CC CAAB55090 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention. AAB5971 to CC CAAB55090 represent invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even consequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,

 The invention relates to human nucleic acids (AA157798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynuclectides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity. Prager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

 monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for blosynthesis and biodegradation, especially biosynthesis of Vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes related diseases. In addition, the genome sequence and proteins lencoded by it are useful in pharmaceutical and
 Genomic sequence for Listeria monocytogenes, useful e.g. for treatment and prevention of Listeria and related bacterial infections, and related polypeptides {}^{\dagger}

 Score
 d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

 GENERAL INFORMATION:

APPLICANT: Sa-No. 6030807ueira, Isabel
APPLICANT: de Lencastre, Herminia
APPLICANT: de Lencastre, Herminia
 TITLE OF INVENTION: HIGHLY REGULABLE PROMOTER FOR HETEROLOGOUS GENE TITLE OF INVENTION: EXPRESSION
 NUMBER OF SEQUENCES:
```

- CATALYTIC ACTIVITY: ATP + L-ribulose = ADP +
 G
 œ
 send
 PATHWAY: L-Brabinose catabolism; second step.
INDUCTION: Transcription is repressed by glucose and by the binding of Brak to the operon promoter. L-arabinose acts inducer by inhibiting the binding of Brak to the DNA, thu allowing expression of the gene.
SIMILARITY: BELONGS TO THE RIBULOKINASE FAMILY.

 GLYCEROKINASE / XYLULOKINASE FAMILY.

CAUTION: WAS THOUGHT BY REF.3 TO BE A HUMAN SEQUENCE AND WAS CALLED BY THEM BRAGI (BRAGIN. RELAYED APOPTOSIS GENE) (BRAGI)

WITH A ROLE IN APOPTOSIS. THE DNA SEQUENCE OF THE REGION THEY SEQUENCED IS MORE THAN 99% IDENTICAL TO THAT OF THIS E.COLI GENEE. PUTHERMORE THEY CLAIM 'EXTENSIVE SIMILARITY TO THE BCL-2 FAMILY OF GENES.' SUCH A SIMILARITY IS NOT SIGNIFICANT AND THIS PROTEIN IS MUCH MORE LIKELY TO BE A SUGAR KINASE. AND THIS PROTEIN IS MUCH MORE LIKELY TO BE A SUGAR KINASE.
 SIMILARITY: BELONGS TO THE FUCOKINASE

 gene and
e.g., ara
cells -
 used in positively selecting transgenic cells from a population of cells using the positive selection method, the presence of the gene of interest in the genetically transformed cells may be determined without the disadvantages associated with traditional negative selection systems. Positive selection of the transformed cells. The transformed cells may be identified by simple visual means without transformed cells may be identified by simple visual means without the use of a separate assay to determine the presence of a marker gene. This technique also avoids the release of antibiotics or other dangerous genes into the environment. The present sequence is Escherichia colistrain C ribitol transporter encoded by ribitol operon (rtl operon). The operon also encodes ribitol dehydrogenase and ribitol kinase.
 involves conferring to transferred cells the ability to metabolise arabitol, ribitol and/or mannitol. The positive selection method is

 Q
 CC Also described are: (1) nucleotide sequences (II) encoding (I); and (2) CC vaccines against P. falciparum infection comprising (I) or (II). CC (I) and (II) are useful for the development of vaccines against CC P. falciparum infection. (I) and polyclonal antisera or a monoclonal CC antibody raised to immunogens comprising the sequences of (I), are CC useful in the detection of infection with P. falciparum. Furthermore, CC (I) (especially when they are rifins or secreted or membrane proteins) CC can aid the identification of drugs to treat or prevent P. falciparum CC infection, or they can be used to identify drug resistance in CC p. falciparum. Sequencing of the Plasmodium chromosome 2 and the CC subsequent identification of proteins encoded by it will help to expand CC our understanding of parasite biology, a process hampered by the CC complexity of the parasite biology, a process hampered by the CC vaccine and drug development. Parasite resistance to drugs and mosquito CC resistance to insecticides have led to a resurgence of malaria in many CC parts of the world, and there is a pressing need for vaccines and new CC crossistance to AAA70078 to AAA70287 and AAB18144 to AAB18152 represent nucleotide and protein sequences given in the present invention, but which are not conscient and within the present invention, but which are not conscient and within the present invention.

 The invention relates to determining whether a candidate nucleotide (ABA82938-ABA82971) or polypeptide (ABA47296) encodes/functions as a multidrug resistance (MDR) efflux pump comprising, searching a database for sequences high identity known MDR efflux pumps and then deleting/mutating an identified region of the DNA in a bacterial cell and determining whether the bacterial cell exhibits increased or decreased sensitivity to an antibacterial agent The identified pumps are useful for further identifying MDR efflux pumps that may be used as drug targets to increase the sensitivity of cells to antibacterial agents. Cells comprising the identified pumps may be used to screen for potential blockers or inhibitors of MDR pump function or gene expression.
 Claim
 Determining whether a candidate nucleotide or polypeptide encodes/functions as a multidrug resistance (MDR) efflux; searching a database of nucleotide/polypeptide sequences high identity to known MDR pumps -

 The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence is useful in the detection and/or amplification nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The
 invention helps research in lactic bacteria, particularly production of yogurt and cheese.

 from Pseudomonas mendocina KR-1. The protein increases resistance to solvents and antibiotics, and is used particularly for constructing strains that produce p-hydroxybenzoic acid. Overexpressing the efflux system or its expression from a plasmid vector increases resistance of bacteria to a variety of toxic substances, while inactivating an efflux

 The present sequence represents a putative efflux protein, designated 4.5x, isolated from Pseudomonas mendocina KR-1. The putative efflux 4.5x gene (I) is located immediately downstream of the pobA gene in Pseudomonas mendocina KR-1. The present invention also describes: (1) a chimeric gene (II) comprising (I) operably linked to at least one suitable regulatory sequence; (2) a transformed host cell (III) comprising (II); (3) isolation of (I); and (4) a complement of (I). (II) is useful for altering the, level of expression of Pseudomonas efflux protein in a host cell by transforming the cell with (II), and growing the transformed host cell produced under conditions that are suitable for expression of (II), resulting in production of increased levels of
 pseudomonas efflux proteins in the transformed host cell relative to expression levels of an untransformed host cell. (I) is useful for isolating cDNAs and genes encoding a homologous putative efflux 4.5x gene from the same or other bacterium species. (I) is useful as a restriction fragment length polymorphism (RFLP) marker, and for carrying out nucleic acid amplification-based methods of genetic and physical mapping. (I) is useful for probing an organism's efflux system to gain an understanding of the mechanism of solvent tolerance.
 Novel isolated Pseudomonas efflux polynucleotide, useful for probing organism's efflux system to gain understanding of the mechanism of solvent tolerance and as restriction fragment length polymorphism
 solvent tolerance.

 cc streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS cc (Streptococcus/GBS), comprising one of 5483 sequences (S1), given in ct the specification. The proteins have antibacterial and antiinflammatory cartivity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and cantibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. (C. Nucleic acids encoding (I) are used to detect Streptococcus in a cc biological sample. (I) is used to determine whether a compound binds to cc (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to determent and sending (I), may be considered as a vaccine or diagnostic composition. The disease caused by CS streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity contrologicus profesions and distinguishing/identifying contrologicus profesions.

 The present sequence is a Pseudomonas stutzeri open reading frame-N (ORF-N) protein. The Pseudomonas stutzeri genome includes ORFs that encode enzymes required for biosynthesis of pyridine-2,6-bis (thiocarboxylate) (PDTC). The ORFs encoding PDTC are especially useful in environmental remediation methods, e.g. phytoremediation, solution mining mobilisation, immobilisation, waste water purification, solution mining mobilisation, immobilisation, detoxification, redox state modifier or modification of metal ion reactivity. In particular, the ORFs are useful for degrading carbon tetrachloride and removing metals from substrates, e.g. soil, or water.

 The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA0304). The genome sequence and fragments of it are useful for selecting probes and primers for detecting genes in L. monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins expressed from the genome sequence are useful for raising specific antibodies, identification of L. monocytogenes and related organisms, and for biosynthesis and biodegradation, especially biosynthesis of vitamin B12. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expresses in addition, the genome sequence and proteins encoded by it are also as the genome sequence and proteins encoded by it are defining the genome sequence and proteins encoded by it are selecting compositions for the treatment or prevention of infections by L.
 monocytogenes and related organisms.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

Corynebacterium glutamicum nucleic acids encoding and membrane transport proteins or their portions, identifying C. glutamicum or related bacteria, and transformation and g membrane s, useful f nd as marke markers for construction or

Claim 20; Page 799-801; 1119pp; English

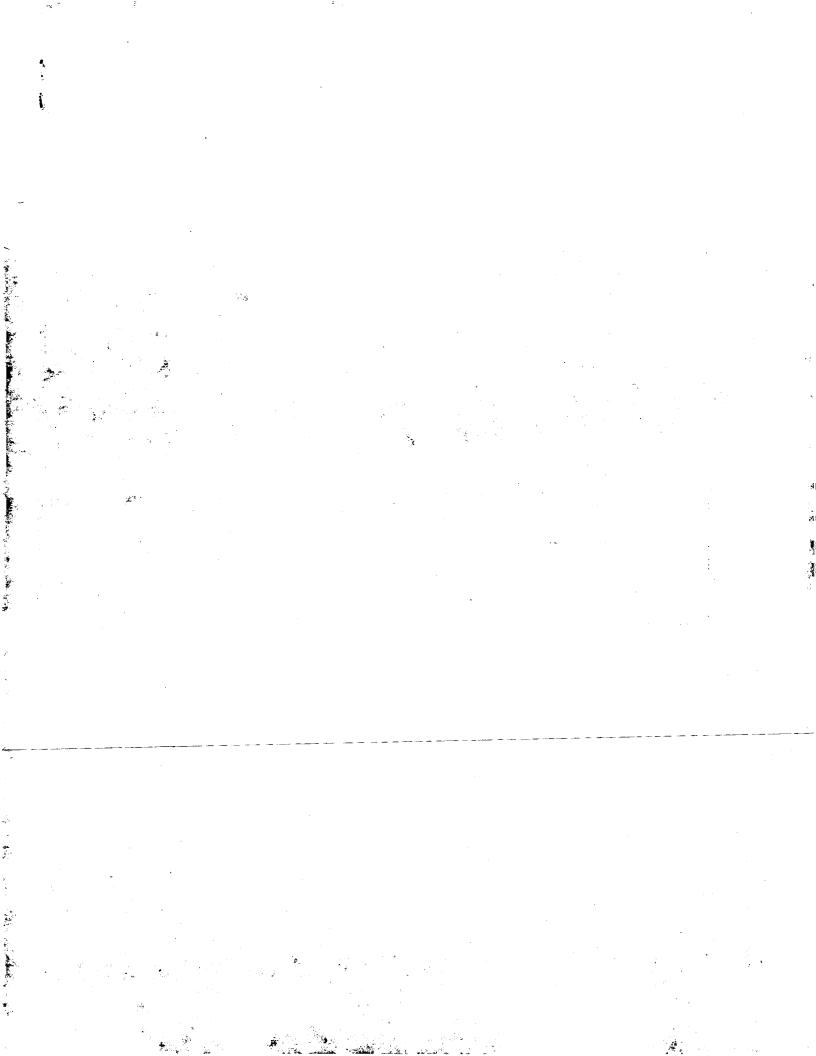

AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane construction and membrane transport (MCT) proteins given in AAB76510 to AAB76847. The MCT nucleic lacids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation.

AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention.

 Score
 d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

Title:
Perfect score:
Sequence:
 Post-processing: Minimum Match 0%
Maximum Match 10
 Total number of hits satisfying chosen parameters:
 OM protein -
 Scoring table:
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 VARIANT GSD-IB GLU-149.
 - ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.

- TISSUE SPECIFICITY: MOSTLY EXPRESSED IN LIVER AND KIDNEY.
- DISEASE: DEFECTS IN G6PT1 ARE THE CAUSE OF GLYCOGEN STORAGE DISEASE IB (GSD-1B).
- SIMILARITY: BELONGS TO THE SLC37A FAMILY OF TRANSPORTERS.
- CAUTION: REF. 4 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 128.
